APC Smart CAT is a visualization application that enables the operator to view the performance of complicated networks of cables, power transmission and distribution lines, and other active/passive components. The application takes advantage of modern technologies such as 3D rendering, virtual reality and image processing and allows you to visualize the status and performance of such networks, whether in a simulation or in real time. The offering from SANS is its Critical Infrastructure Risk Simulator (CIRS). This is a major expansion of the CIRS solution that can be used to quantify risks in a network of systems. The critical infrastructure market is very large and complex, and attacks are increasingly common. It is more important now than ever that all systems in a network have a process that is able to quantify and prioritize the risk associated with each system. The CIRS solution is designed to do just that. It provides a common language for system managers, to see the risks of their systems and to know how the aggregate risk of all the systems in a network is impacted. It provides a unified interface for all systems in a network. It provides the ability to segment risk, and to isolate or mitigate security issues at the system level. SANS has expanded the capabilities of its CIRS solution to support risk management and penetration testing applications, for the needs of enterprise and government customers. Through expanded capabilities that include system mapping, simulation of interconnecting networks, and mapping of risks as they affect critical infrastructure, the SANS CIRS solution provides a robust risk management tool. Robust Risk Management: Delivering on the promise of CIRS New module lets users run CIRS in the cloud Mapping network interconnections and risks using CIRS is currently only available for on-premise deployments. But now users of SANS CIRS can test their network using the cloud. By adding the use of the cloud, SANS now provides users with the capability to map and visualize risk from the cloud or a combination of the cloud and on-premise. The cloud component provides the mapping engine and the risk visualization capabilities, and the on-premise component provides the complete CIRS simulation environment. SANS CIRS can simulate real-time risk propagation within the cloud, combining risks of simulated assets and assets in the cloud, and in addition, the cloud offers the opportunity to simulate risk within networks in the cloud. This is particularly beneficial to organizations that 82157476af
